

Chemtech®

NEW

A REGULAR, PREVENTATIVE REGIME OF TREATMENTS IS IMPORTANT TO KEEP WATER-BASED SPORTS SURFACES AS CLEAN AS POSSIBLE, TREATING AGAINST BIOLOGICAL GROWTH, ALGAE & LICHEN

What is Chemtech®?

- ✓ Chemtech® is a water-based concentrated liquid biocide for the fast, effective treatment of synthetic surfaces against biological growth, algae and lichen
- ✓ Chemtech® is a super concentrated active cleaner for biological growth, algae & lichen, four times stronger than most biofilm cleaners
- ✓ Acting as a biocide, Chemtech® can also have some residual benefits - preventing biofilms from quickly returning
- ✓ Chemtech® treats artificial turf with no risk of staining or damage, and can be used year-round

Why is a Chemtech® treatment required?

- ✓ Hockey pitches and other water-based surfaces are greatly affected by weather and the environment; they can experience high levels of biofilms and other vegetation if not correctly maintained

When & how should a Chemtech® treatment be completed?

- ✓ A Chemtech® treatment should be applied to the full surface as part of a routine maintenance programme
- ✓ This will help to ensure that the surface looks good, but is also safe for users, as traction is not impaired by vegetative growth
- ✓ Supplied in 5L tubs, Chemtech® is diluted then applied to the surface by brush or spray. Chemtech® must be applied by competent personnel to ensure its safe application. Technical Surfaces' professionally-trained Site Technicians can provide this service where required.
- ✓ Treated surfaces are ready to use once the Chemtech® application has dried

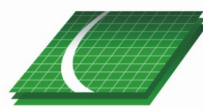

Chemtech® treatments have been completed on the water-based sports pitches at **Loughborough University** & **Lee Valley Hockey Centre** in London
